To Whom It May Concern:

As a scientist for the past 25 years, I am in possession of several degrees in engineering, computing science and also a postgraduate degree in nuclear physics. At my University, Imperial College, London, Dr. Fritjof Capra, a fellow student, wrote a best selling book, The Tao of Physics. The book points at the parallels between the ancient concepts in religion and the most modern findings in advanced physics.

This book helped to prepare me in appreciating the towering stature of Bhagwan Shree Rajneesh. His teachings are of the deepest and profoundest significance and at the same time they are wonderfully practical. The effect in practical terms has been a transformation in my whole outlook on life - much more loving, much more peaceful and at ease, much more harmonious with existence as it is.

His scholarship coupled to his rare insight in the true meaning hidden in the scriptural heritage of many different religious traditions have resulted in a vast outpouring of inestimable value - a great and unique contribution to the arts and sciences.

In my view, and above all in my experience, Bhagwan Shree Rajneesh is a religious teacher and scientist of the greatest standing.
